1 Executive Summary

The **Tehseen Tech edition of Manus Skills** is a public, registry-backed collection of reusable Manus AI agent skills. The current repository contains 78 registered skills across 13 categories, including one orchestration meta-skill. The recent release focused on a practical usability problem: users should be able to describe the outcome they need without first knowing or naming the internal skill that can help.

To support that behavior, every validated skill now exposes request-oriented discovery metadata. Descriptions explain the capability, the context in which it applies, and the automatic activation rule. The central registry was synchronized with the files on disk, two missing-frontmatter exceptions were repaired, and the complete source-plus-installed collection passed the final automatic-trigger audit.

Release position

This is a **metadata and routing improvement**, not a guarantee that every ambiguous request will select one unique skill. Matching still depends on request context and the routing layer's judgment.

2 Repository Snapshot

The repository is hosted publicly at github.com/TehseenTech/manus-skills. The current local release is on the main branch and contains a reconciled registry, automatic-discovery metadata, shared Python utilities, shell integration, categorized skill files, and a full-stack orchestration meta-skill.

Metric	Result	Interpretation
Registered skills	78	Every registry key maps to a skill definition.
Skill files on disk	78	The filesystem and manifest are aligned.
Categories	13	The collection spans analysis, automation, design, development, integration, specialized, foundation, workflow, utility, and meta-skill groups.
Meta-skills	1	full-stack-builder orchestrates higher-level application workflows.
Automatic-trigger coverage	128 / 128	All repository and installed skill files passed the trigger-metadata check.

3 Automatic Discovery Contract

The update applies one consistent frontmatter contract across the collection. A skill's metadata must identify its name, its author, and a concise description that is useful to routing. The description should be written around a user request rather than around an internal implementation detail.

Metadata signal	Required behavior
Capability	State what the skill produces or enables.

Request context	Name the kinds of tasks, problems, or goals that should make it relevant.
Activation rule	Include: “Apply automatically when the request matches; the user does not need to mention this skill.”
Registry parity	Keep the central <code>skills.json</code> description synchronized with the corresponding <code>SKILL.md</code> frontmatter.

This contract creates a better discovery signal while preserving a meaningful boundary: a vague request can still require clarification, and overlapping skills can still require routing judgment.

4 Completeness and Repairs

The repository was first reconciled against the filesystem so that all 78 on-disk skill definitions could be represented in the registry. The automatic-discovery update then processed both the source repository and the installed Manus collection. The audit detected two repository skills without the standard opening frontmatter block. Both were repaired before the final validation run.

Skill	Issue found	Repair applied
debug-mining-engine	Missing opening frontmatter	Added valid name, author, and request-oriented description fields.
skill-arsenal-builder	Missing opening frontmatter	Added valid name, author, and request-oriented description fields.

The repair was performed from the actual skill content rather than from a generic placeholder. This preserves the distinction between a valid metadata repair and an invented capability claim.

5 Validation Results

The final audit covered 78 repository skills and 50 installed Manus skills. The six repeated names between the two collections are expected source-versus-installed copies; they were reported for visibility and were not treated as registry conflicts.

Check	Result	Meaning
Automatic-trigger metadata	128 / 128	Every checked file contains the required activation language.
Registry entries	78 / 78	The complete manifest is represented and path-aware.
Registry synchronization errors	0	Registry descriptions and file metadata agree.
YAML / frontmatter errors	0	Metadata can be parsed without loss.
Python syntax errors	0	Bundled Python skill scripts compile successfully.

Verified outcome

The collection is structurally usable for automatic discovery. The audit does not claim that all skill workflows are functionally identical, nor that external credentials and third-party services are available in every runtime.

6 Category Coverage

The registry now exposes 13 categories. The distribution below is descriptive rather than a quality ranking; it shows where the collection's capabilities are concentrated.

Category	Count	Representative scope
Analysis skills	8	Client, systems, traffic, market, and product analysis.
Automation skills	6	GitHub synchronization, repository organization, and delivery automation.
Design skills	8	Brand, frontend, spreadsheet, video, and visual design.
Development skills	6	Application patterns, access control, game, persona, and serverless development.
Integration skills	6	MCP configuration, recovery, testing, building, and voice AI.
Specialized	2	App-store submission and work-access demo generation.
Foundation through Tier 4	15	Core schemas, APIs, testing, deployment, advanced features, and specialized integrations.
Utility skills	12	Documents, spreadsheets, PDFs, PPTX, discovery, handoff, debugging, and skill tooling.
Workflow skills	14	Planning, parallel work, reviews, debugging, testing, verification, and branch completion.
Meta-skills	1	Full-stack orchestration.

7 Public Release Readiness

The local repository is ready for public publication as a Tehseen Tech package. Its README has been rewritten to reflect the current 78-skill state rather than the stale 55-skill description. A dedicated `TEHSEEN_TECH.md` file records the branding and maintenance scope transparently: Tehseen Tech is responsible for the current curation, metadata normalization, registry reconciliation, documentation polish, and public packaging of this edition.

Public visibility should not be confused with a blanket reuse license. Before redistributing or commercializing individual skills, users should review the repository's license, the provenance of each component, and the terms of any external service or integration it uses.

Release item	Status
Repository visibility	Public GitHub repository at TehseenTech/manus-skills .
Branding	README and TEHSEEN_TECH.md identify the Tehseen Tech edition and maintenance scope.
Registry	skills.json contains 78 entries with author and maintainer metadata.
License	The repository-level license is MIT in LICENSE; component-specific terms remain applicable.
Validation artifacts	docs/auto-trigger-validation.json and docs/automatic-trigger-audit.md provide supporting evidence.
Publication action	Push the final commit to origin/main after local review.
